Surfer Analogy:
Through practice you will become able to identify these 'stealth time cycles' or better yet "wave pockets".

If you keep practicing mapping waves of rhythm on different timeframes on different assets, you can begin to identify these "wave pockets". Imagine a surfer, they are able to identify a wave forming. They get into position before it forms, then they enter into the "wave pocket", the area where the wave begins to fold over.

In a similar fashion, with these stealth time cycles, you will often be trading a time cycle rhythm that most people will not identify - because the timing will not always be the "exact wick low" of the time cycles people fixate on. Yet, it will allow you to surf price action to profits consistently, predictably and with precision.

These time cycles may often be subtle repeatable patterns that sometimes combine with major "normal" time cycle bottoms allowing you to catch larger upside moves beyond the statistical averages you identify.

Example 2 - **DOGE**

To highlight the importance of focusing on the rhythm rather than precision, for this example we will look at DOGE. Month after month I was able to make profitable trades on DOGE without perfectly precise time cycles. But instead, focusing on placing my time cycles in a way that captured the most pivots and the most of the move.

This time cycle was identified with this mindset, but then once identified, I used back testing to collect data on the asset. I looked at:

A. Average expansion from a pivot bottom.
B. Average time between pivot bottom and correction/pullback beginning.
C. Average fibonacci retracement on corrections from the bottom pivot.

By back testing in this way I was able to formulate a repeatable, high probability plan for when to look to place the trade, when to take profits/ hedge with shorts, and get an easy gauge on whether the asset is showing strength or weakness.

Key Principle - Statistical Back-testing for TP Optimisation:
Pay attention to the principle being shared here.
You can refine your edge, and make more profits, but from your exact same trading system, by backtesting your system to generate statistics. And then, using those statistics to optimize profit taking, using time and fib retracement data to know when is best to add to a winning trade, or identify weakness, meaning your upside targets are not likely to be met, and hence you should be taking profits earlier - avoiding round tripping. Back testing in this way is a powerful method of extracting maximum profits from a setup/ trading strategy that you can use to apply to your own “A+ setup” trades.

Now let’s look at the example.

Step 1

- Plot the 29D cycle in 2 clicks (July 4 & Aug 2).

Step 2

Pre-plan TP targets based on pivot averages (found through back-testing the time cycle):

- +8% = minimum (1/10 pivots)
- +20% = standard (9/10 pivots, ~6D from pivot)

Step 3

Prepare for pullbacks.

- Most local / cycle tops form on days 6–8.

- Pull a Fib from pivot low → day 6–8 top.
- Look for demand holding near the 0.382 retrace.
- Deviation is fine intraday, but must bounce / hold on 1D for strength.

Here is an example of a live trade for the September 29, 2025 Time Pivot.
So, the local range high and range low are plotted to give the demand zone in price we want to watch and potential high target to target - as per normal trading.

However, we use the time cycle for confluence to know to look for longs ±3D from the time pivot. There are not always clear accumulative structure patterns moving into the pivot, but in this case there was a LTF Wyckoff Model 2 accumulation to support the long trade entry. From there you simply follow the TP targets that are obtained simply by backtesting the time cycle averages. The pattern was simple, at least 8% move in the first 6 days under bearish conditions and down trend (1/10 times) but a 20% move in 6-8 days for 9/10 pivots. At least a local top was being put in on days 6-8, where standard fib retracement of 0.382 fibonacci gives confluence for demand where price is likely to hold for a bounce or continuation higher.
Depending on market conditions & confluence you can even target TP1 as 20%.

Either way the system formed by:

1. **Rhythm> Precision:** Focusing on finding a “wave pocket” where you can ride a dominant time cycle, rather than trying to only look at the technical lowest low and next major low as the basis for identifying a time pivot.
2. **Back testing:** Measure the time pivot average move up. Identify the weakest move expectations. Notice the average local topping date = More time confluence on when to look for TP other than just price *(a mental guide to help when you are being overly bullish biased, waiting for higher)*. It can help you identify when you are likely being too greedy holding the long without taking any partial profits.
3. **Pre-planning:** Ahead of time, plot out the ideal time pivot and price levels for Entry and Take Profits (both time & price).

The image below illustrates a few examples of how month to month repeatable profits can be made with time cycles like this.

In the next images below I give an example text book breakdown of how once you identify a dominant time cycle (and/or) wave pocket, you can backtest to get stats on the typical behavior of price action out of each time pivot to take profits and compound long trades more effectively. This example breaks down $DOGE statistics being used step by step to hit take profits with precision.

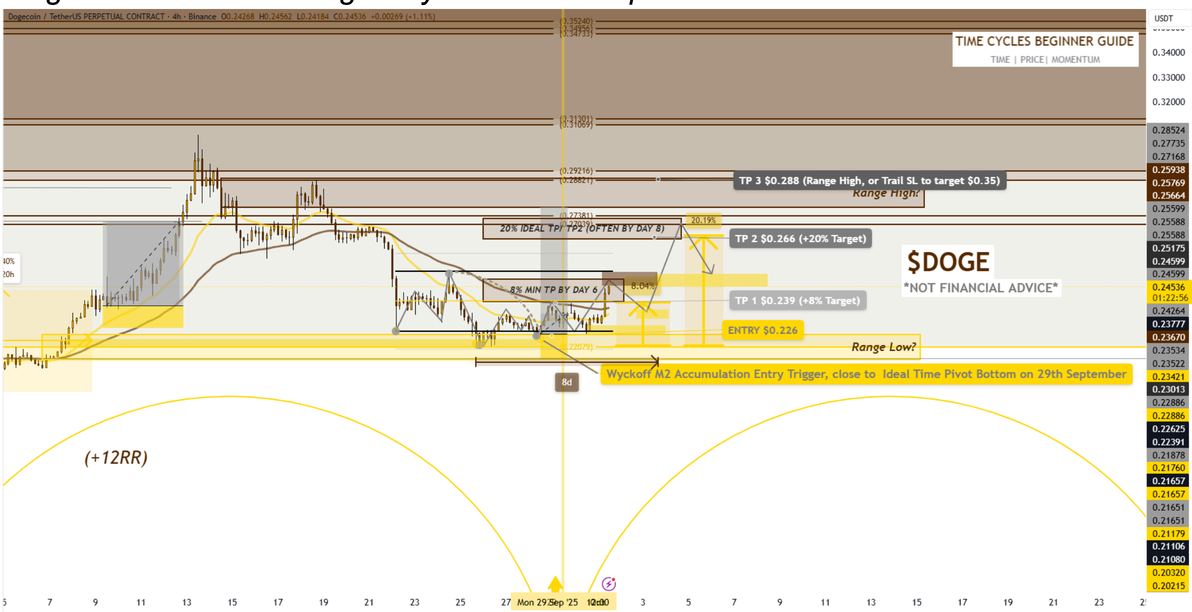
I will show this in 3 images to give a feel of how step by step I mapped (estimated projections) of price action for TPs and a continuation long in real time.

Note: Sometimes the “actual” bottom of the time cycle will be precisely on the expected date. However, sometimes it is not on that exact date, but either an actionable continuation trade, higher low, or structure entry such as accumulation patterns will hit on/ very close to the time pivot.

First, the below 2 images show the zoomed out and zoomed in move down into the time pivot where a low timeframe Model 2 wyckoff accumulation pattern gave added confluence for an entry trigger into the long trade.

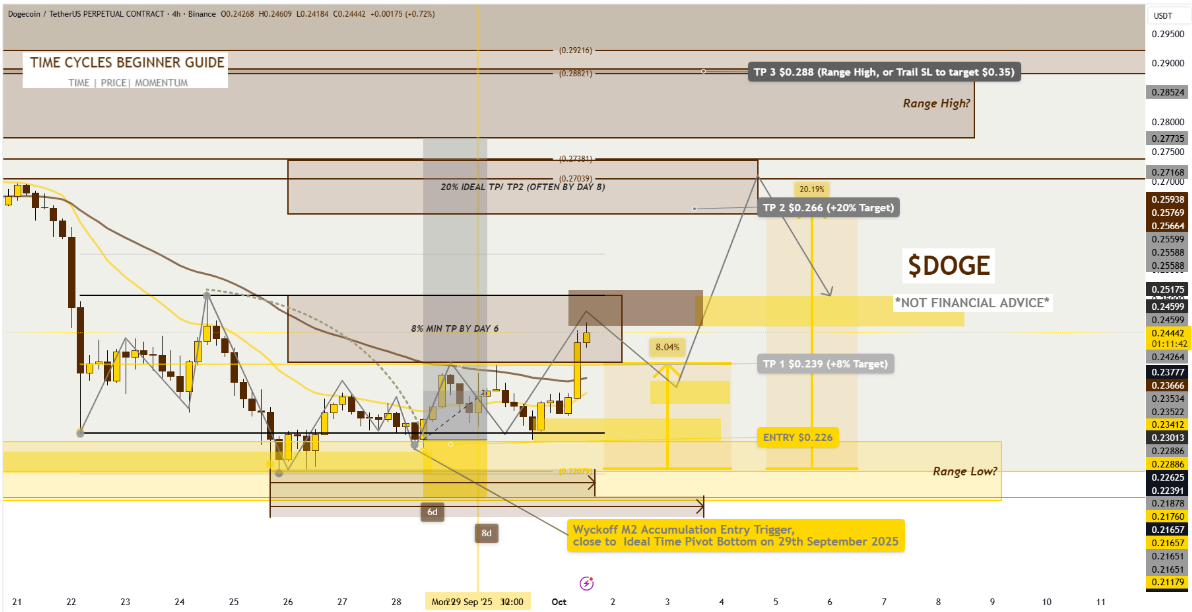
Image 1 - Zoomed out long entry into the time pivot:

Image 2 - Zoomed in long entry into the time pivot:

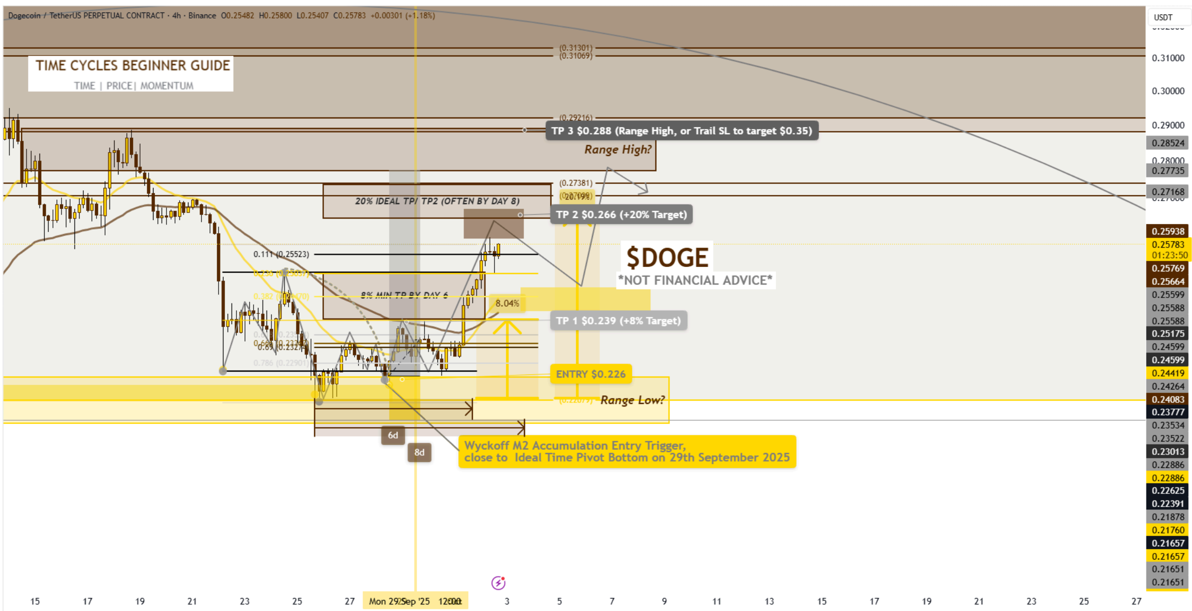


Next I am showing how Take Profit Target 1 is hit, being +8% move up within 6 days of the “actual” time pivot low.

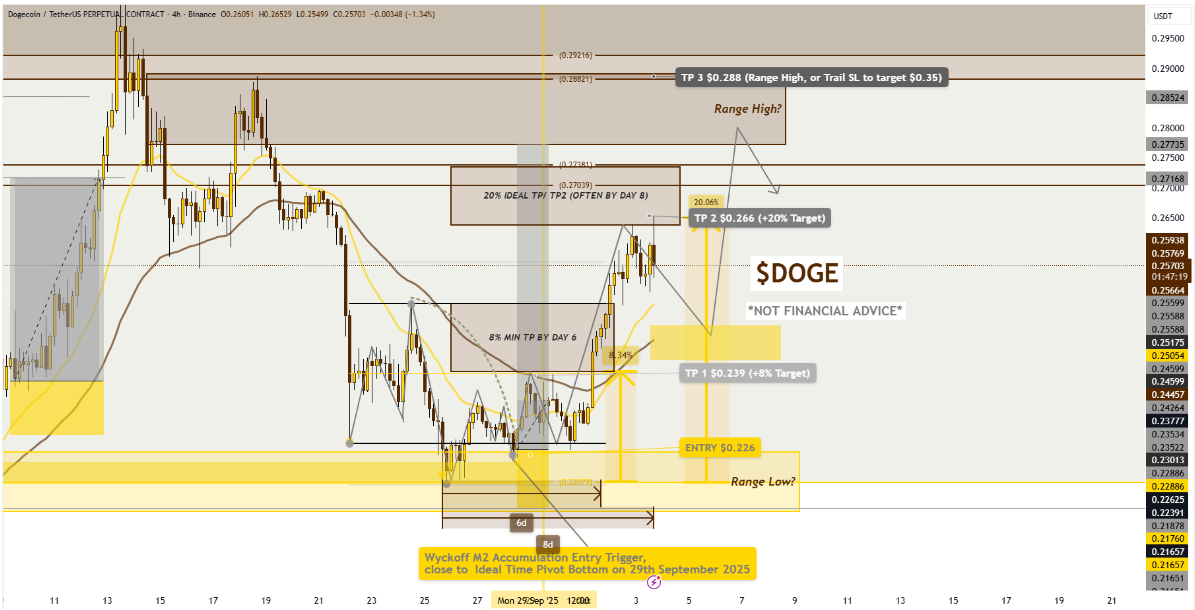
Note: in this case, since price structure gave a higher technical target (wyckoff range high at $0.25) from the local Wyckoff accumulation, TP 1 could have been extended to $0.25 instead of $0.239 (the +8% target). This allowed the opportunity for maximising profits from this long entry.



Next, in the below image I show I pre-planned for the 0.382 fib retracement phase we typically see in the time cycle. So, as I expect price to move to the +20% target by day 8, I used the $0.266 price level (+20% level) to make my fibonacci retracement estimation. I pulled the fibonacci retracement tool from the time cycle low at 0.22, up to 0.266 target to give a 0.382 retracement expectation of ~0.248. This allowed me to map the local demand zone around 0.382 Fib as a long trigger for at least a bounce, but also for potential continuation to the higher TP3 level range high identified.

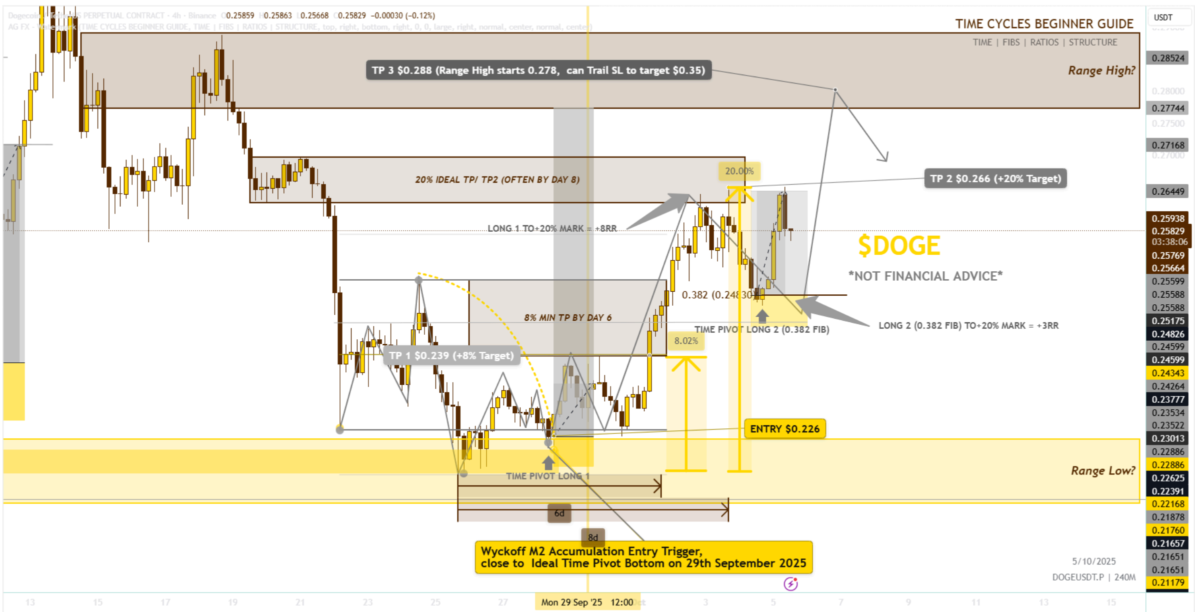


The image below shows price hitting exactly +20% on day 8 from the time pivot bottom and then beginning its correction towards the preplanned 0.382 demand zone.



This final image shows the second long opportunity taking price from almost exactly the 0.382 retracement level back up to the +20% resistance zone for a successful short scalp.

Note: at the 0.382 support we can generally expect either a bounce, or continuation to higher target price levels if the move from the time pivot is strong/ impulsive.



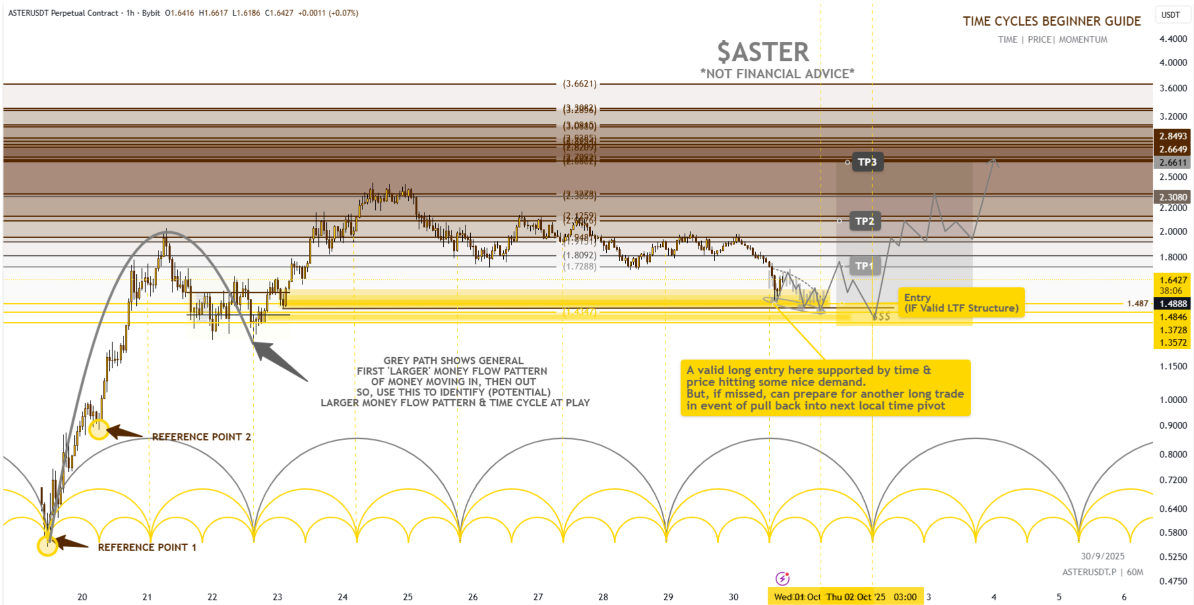
More Examples of Using “Stealth Time Cycles”

Example 3 - **SMCI**

In this example, instead of the reference points being the major lows, the two reference points to draw the time cycle are:
- Reference point 1 = the last low for a breakout and,
- Reference point 2 = the first significant low of a major rally.

Example 4 - **$ASTERUSDT**
This example is a newly launched Altcoin in the Crypto space.
Identifying the time cycles was done by first looking at stealth time cycles (yellow circles). Being that the initial pull back after aggressive move up is used to identify the potential time cycle. Then projecting that forwards you test and see that it is a repeatable bottom found in line with the time cycle. So, we keep it.

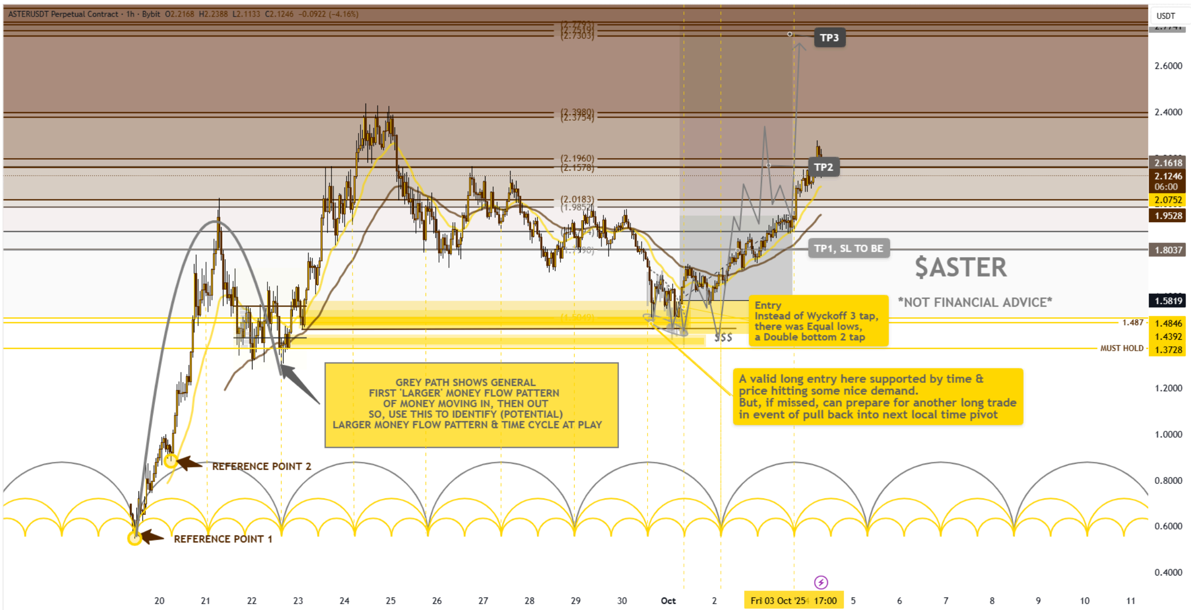
We then zoom out and see the (grey path) larger money flow pattern in play. This is done by eye, as we can see price consolidates for a while then continues another *relatively speaking* larger money flow pattern again of money in and out. As a result we can plot the (grey) larger time cycle as shown. It does not perfectly capture the larger money flow pattern, but generally, it does. And that is sufficient.



I have also shown how even though there was a potential valid long entry with price hitting nice demand into the time cycle pivot bottom, if that entry was missed, then it is fine, we can pre-plan for potential pullback entries into the next time pivots.

Note*:* This example is a new asset, in a high risk, highly volatile sector and on a very low timeframe. So this is perhaps the most extreme example and not ideal. However, the principle can still be applied here.

3 days later you see that there was a pullback but a double bottom (equal lows) instead of 3 tap Wyckoff style entry trigger. The 2 October 2025 pivot did not give a larger correction. Instead a shallow correction before expansion, where 20/50 EMAs had bullish cross over on the 1 hr & 4hr timeframe to support bullish momentum. (see image below).



Lesson: Price rarely moves in the ideal textbook ways often shown. Here I have shown a variety of charts and 'non-ideal' conditions, so you can see how to apply the principle of not needing perfection. You also do not predict, but rather use the time cycles to add confluence to timing your trades, aiding your ability to be patient.
You capture the general money flow patterns, focused on dominant time cycles, so you can predictably, repeatedly add strong time confluence to your trades.

Example 5 - **$APEXUSDT**

This is a similar example to $ASTERUSDT.
This is another high risk crypto altcoin example on the lower timeframe.
Reference point 1 for drawing the time cycle is the last low before the move up.
Reference point 2 is the first clear pullback low for continuation higher.
The below image shows the trade entry into the time pivot for a continuation long.

The below image shows the price expanding upwards from the time pivot.

Key point to note here is that the biggest wick low (September 30, 2025) was more to the left than actually projected with the (yellow) ‘stealth’ time cycles.
However, when it came to taking this continuation long, I still used the original yellow time cycles. Most people would instantly bias to respect the larger wick that was more to the left. This means they would instantly shift the yellow time cycles to the left. But, if you would use the biggest wick as a reference point the long entry timing would have been off.
This means using what most people would logically think is the best and most accurate reference point of the time cycles, is not what actually is most effective.
On the contrary I am emphasising that you instead prioritise the “dominant” time cycle patterns. The yellow time cycles (despite being ‘stealth’) are repeatedly giving accurate pivot bottoms. Money flow rhythm is respecting this timing so we should too.

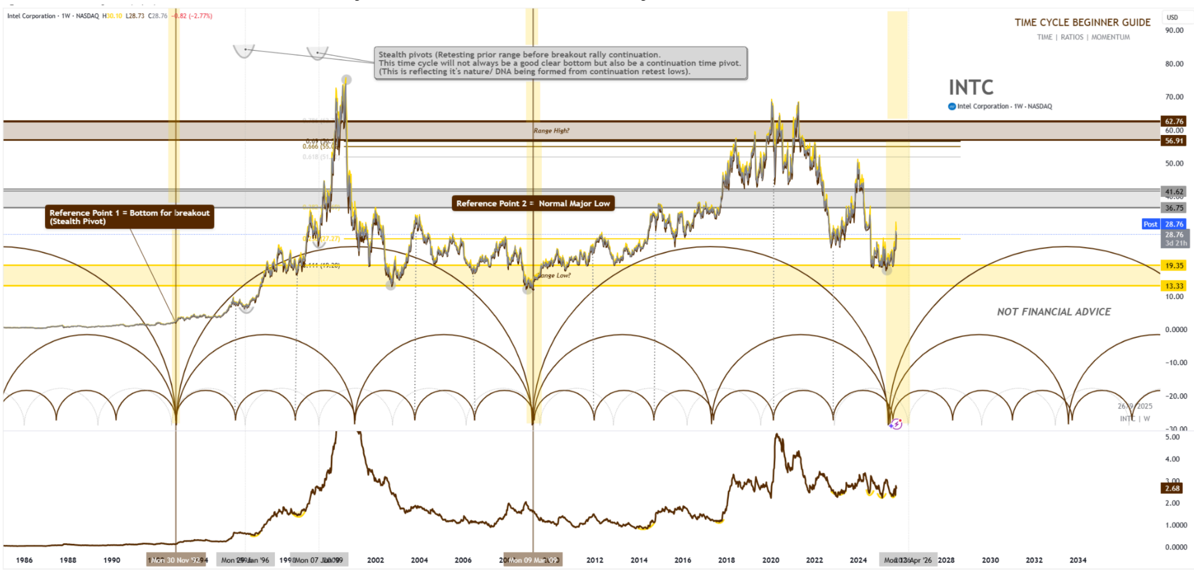
In this example, if you shifted to focus on drawing symmetrical time cycles using the largest, most significant bottoms as I showed, you would still get a close time cycle low projection but, this would make a slightly less accurate pivot projection.
This proves my earlier point, you don’t need to purely focus on overfitting the perfectly aligned tip of a wick for a precise time cycle entry.

Example 6 - **INTC**
This final example below shows Intel, a computing stock.
In this example, I show how “stealth time cycles” using two pre-breakout lows to form time cycles can give a useful secondary time cycle pattern to trade in addition to the main time cycles mapped with the major lows and symmetry.

The reason for this is that when the symmetry low fails to fall when expected, this gives us a secondary reference point for a potential alternative pivot bottom entry on a long.

These pivots are highlighted in grey on the below chart. See also the ‘Brown’ time pivot around 2023/2024. There is a small dip in price into that pivot, but the bigger grey highlighted low just prior was more significant. This low was a stealth pivot showing temporary increased dominance.

When the (brown) dominant time cycles show temporary shifts or outlier pivots, this is often a ‘stealth time cycle’ showing a brief period of additional strength.
In this way stealth time cycles can be used to map a sort of “back up “ time pivot when the usual market rhythm seems out of sync.



Summary

1. Big Idea: Markets Move in Rhythms

- Markets move in rhythms - money flowing in and out.
- Cycles don't predict exact tops/bottoms → they highlight time windows where pivots are more likely (cycles = probability windows).
- Hurst showed markets have repeating nominal cycles (20d, 40d, 80d, etc.).

2. The Nominal Model (Simplified)

- Core cycle lengths double each step:

  20d → 40d → 80d → 20w → 40w → 18m → 54m → 9y.
  Like nesting Russian dolls — small cycles sit inside larger ones.
  These "Common Cycles" work best in Large Indexes and large breakdown/breakout events (20D-20W).

3. How to Use It (Beginner's Edge)

- Don't try to predict exact tops/bottoms.

- Instead, use cycles to build context:
  "This is a likely window for a turn."
  "This rally is due to weaken."
  "This correction is likely near completion."

- Combine with price structure EW, Wycoff, support/resistance for confirmation.
- Use Key Ratios & Momentum Indicators to assess strength & validity of time pivots.

4. The New Paradigm - Seeing With Market Maker Eyes

- **Old view:** view price in isolation, driven by emotion and headlines.

- **New view:** view price as a reflection of capital flows, revealed through ratios.

Ratio analysis trains you to think like a Market Maker. Instead of chasing headlines or single candles, you align with the deeper currents of rotation. You begin to recognize hidden distribution patterns, spot key price levels with institutional context, and understand the *why* behind every move.

5. What Time Cycles Are Not

- Not astrology.
- Not crystal-ball exact dates.
- Not a replacement for risk management.

6. Beginner's Takeaway

- Cycles give when, price gives where.
- High probability zones = key price levels meeting key time "nesting pivots", backed by ratio & momentum - within the valid time window.
- Edge = structure + high probability zones, not prediction.
  (adapt to structure, do not stay stubborn to your exact predicted price level hitting on the exact time pivot date).
- You only need to be able to read the rhythm to ride the wave.
  (Rhythm thinking beats overfitting your time cycles.)
- Use statistics from back testing to aid take profit decision making.

Final Word

The more you use time cycles, the sharper your eye becomes at spotting money flow.
Price is the sea. Time is the tide.
When you learn to read both together — you no longer chase waves.
You position before the tide turns.

Want Mr. Abundance to Coach you 1-on-1?

Trader Alchemy™ — Master Time, Mind & Money Flow
(12-Week Coaching Program)

What we work on:

1️⃣ **Transform Your Trading Psychology**

Rebuild from the inside out. Consciously define and become the version of yourself who achieves your goals as a basic standard — not a lucky streak.

2️⃣ **Time Cycle Mastery**

Learn to read and refine market timing. Take profits with precision, swing or day trade with confidence, and stop round-tripping your gains.

3️⃣ **Capital Rotation Intelligence**

Decode how smart money moves. Read asset ratios and rotate your capital with the market makers — not against them.

4️⃣ **Elite Trading Community**

Surround yourself with high-level traders and investors who understand the psychological and emotional battles we face. Build genuine friendships and accountability that accelerate your evolution.
